mp4, you want to go out for a walk, .mov. I decided to do this for two reasons. First, I was fed up with playing the same music all day and decided to add some diversity. Second, I had some previous experience in web development and so I wanted to learn a bit more. In this post I will show how to install wget and ffmpeg for Ubuntu. Installation Both of them are distributed as deb packages, so to install them, we can install the apt-get tool using the following command: `sudo apt-get install python-software-properties python-software-properties-common` The last command can also be written as: `sudo apt-add-repository ppa:elementary-os/ffmpeg` We can now install wget and ffmpeg using apt-get, but the wget is installed automatically by default. To see what we have installed, we can run the following command: `dpkg -l wget ffmpeg` The output will show as follows: `wget ffmpeg` Simple way of playing In order to play a video file from the shell, we have to install avconv, the free version of ffmpeg. To install, we can use the following command: `sudo apt-get install avconv` This will also install a lot of other utilities like mplayer, so, we can just use wget to do the trick: `wget -O video.mp4` Since we have just installed avconv, the preceding command is not going to work. So, we have to install the avconv, `sudo apt-get install libavconv` Then, we can run the ffmpeg command, `ffmpeg -i video.mp4` It is not going to work either. However, if we try to run the wget command, it will work. But this is not going to work either. However 82157476af
